# High Speed Internet

Broadband is often called high-speed Internet, because it usually has a high rate of data transmission. In general, any connection to the customer of 256 kbit/s (0.250 Mbit/s) or more is considered \_\_\_\_\_  
\_\_\_\_\_.

In practice, the advertised bandwidth is not always reliably available to the customer; ISPs often allow a greater number of \_\_\_\_\_ than their \_\_\_\_\_ can handle, under the assumption that most users will not be using their \_\_\_\_\_ very frequently. This aggregation strategy works more often than not, so users can typically \_\_\_\_\_ to their full bandwidth most of the time; however, peer-to-peer (P2P) file sharing systems, often requiring extended durations of high bandwidth, stress these assumptions, and can cause major problems for \_\_\_\_\_ who have excessively overbooked their capacity. For more on this topic, see \_\_\_\_\_. As takeup for these introductory products increases, telcos are starting to offer \_\_\_\_\_ services. For existing connections, this most of the time simply involves \_\_\_\_\_ the existing \_\_\_\_\_ at each end of the connection.
