Wacky Tacky Immune System

The immune centers of your body are located in the _____, _____, _____, and bone marrow. From these centers your immune cells circulate around your body, looking for the " _____", foreign bodies, or antigens which can appear in the form of _____, _____, and even _____. When a disease is _____ by your _____ their response depends both on the disease and on the particular immune cell. Phagocytes (a type of white blood cell) actually _____, _____, or eat pathogens. Phagocytes also consume "dead cells" in our body, and play an important roll in allowing wounds to heal. Lymphocytes _____ antigens by creating antibodies, or _____ granules. Lymphocytes also destroy cells which have been _____ by a virus, and tag antigens to be attacked later. After _____ a particular disease lymphocytes will keep a profile and _____ the disease throughout your life. Should it appear again, they will _____ eliminate it. This _____ effect of immune cells led to the idea of a vaccine: weakened antigens which could be _____ into your body. Your immune system can then " _____" on this _____ form of a disease. The next time a disease _____ your body, your immune system draws upon its memory to quickly _____ it.
