# RSI Case 1

EH is a 60 kg, 17 year old male with nka in the PICU being treated for endocarditis who is on CVVHD. His PMH is significant for JIA and asthma. Approximately 1 hr ago a BAT team was called due to acute mental status changes and left sided facial droop. Imaging is concerning for a subdural. You are called to the room to help prepare meds incase of decompensation. Neurosurg is at the bedside discussing bolt placement. When you arrive the attending is calling out intubation drugs. First, He requests \_\_\_\_\_medication\_\_\_\_\_, followed by \_\_\_\_\_medication\_\_\_\_\_. Finally he requests \_\_\_\_\_medication\_\_\_\_\_. What dose of each do you draw up?
