Triangles

Cross sections are when you cut the shape in half any way. The _____ shape serums are the two shortest lengths are longer than the longest length. The other triangle serum is all three angles add up to _____ number.

The four angle relationships are _____ type of angle relationship which is when you do _____ number minus the given number and it will give you the missing number. _____ type of angle relationship is when you do _____ number minus the given number. _____ type of angle relationship is when you find the other angle that adds up to _____ number. The way you figure out _____ type of angle relationship is the two angles have the same side and vertex. The way you find the sum of the interior of a _____ shape is you see how many sides there are and subtract 2 from it. Then you divide 180 by that number. A _____ type of angle triangle is a triangle that doesn't meet either of the serums. A _____ type of angle triangle is a triangle that you can't make more than one triangle out of the three measurements. An _____ type of angle triangle is a _____ shape you can make more than one _____ shape out of it. Similar triangles are triangles that are congruent and similar.
